

Mowing grass

Mowing grass regularly is absolutely vital for proper grass maintenance. We recommend that you mow the grass at least once a week, even twice a week in spring. Pay sufficient attention to the grass mats to keep your grass optimally cared for and to reduce the chance of the formation of weeds and grass diseases. This will allow you to optimally enjoy a great green grass lawn.

When to mow for the first time?

Mowing season is from March to October. Check the weather conditions before mowing the grass. It is best to mow the grass during dry weather. If the grass is wet, then there is a chance your lawn mower will get blocked.

Mowing for the first time after new grass is placed

Do not wait too long for your first time mowing! You need to mow the grass as soon as the grass is 4 cm high. This is usually the case after one week. Mow carefully the first time and do not cut the grass too short. Do this in multiple steps over a couple of days until you have the desired length. Especially for the first few times the grass is mowed it is important to collect or remove the mowed grass.

How short should the grass be?

Do not cut the grass too short the first time. The grass mats will wear faster if the grass is cut too short. In spring, a length of three centimetres is enough. During summer, it is best for the grass to be slightly longer, especially under extreme drought (+30°C). Keep the grass at four centimetres in that case to prevent dehydration and discolouration.

What kind of mower do I need?

You can choose between three kinds of mowers.

Cage mower

A cage mower is used to cut the grass short. This mower cuts the grass, resulting in cleaner cut grass. However, a cage mower suffers from more wear than a rotary mower and thus requires more maintenance.

Rotary mower

A rotary mower slings off the grass because the blade in the mower rotates quickly. This makes the grass a bit rougher. When mowing, take care of stones, twigs or other waste that might get slung away at high speed; avoid contact as much as possible. Like the cage mower, the blade of the rotary mower must be sharpened every year for a good result.

Robot mower

Mowing the grass every day really is best. A robot mower is the perfect solution.
